

Throwing an exception. Didn't make since to me considering only my PC was doing it. Compiled or pulling release both do it. Port name for the printer port returns null. Tried fussing with it and commented out the last if statement. Does anyone uses printer port for an adapter? Just asking because I was confused about the purpose of the last if in ports.

  The printer port is ignored since there shouldn't be any tool on the market that can connect to it.

 I need to uncomment it and see if it's a virtual port or the com port. If I ignore the exception no ports show up in the drop down menu.

██████████ I would recommend doing a fresh pull of pcmhammer since the object should not be null.

██████████ for a quick fix, check if the item is null and then just continuing the loop would be the best bet

it just disregards all ports. I commented it out and everything works. If I am a unicorn its no issue however there has to be others that will stumble on this issue. uninstalling my printer would drive me nuts because of wanting to print while fussing with code, autos, and ect... having to use different pc's for several reasons.

I have my printer on an IP and USB. It's either the virtual printer port or null modem. Regardless my PC has marked this property as null.
